Vizio New Vizio TVs use motion smoothing to make the content you're watching smoother. It looks good for some content like sports, but can ruin the feeling of movies and TV shows. What is smoothing motion anyway? Smoothing the movement works by increasing the frame rate of the content you watch on TV. It does this by artificially adding additional frames between each real frame to synchronize content with display upgrade speeds, which can sometimes double or even quadruple the perceived upgrade speed and smoothness of the image. However, it doesn't always look good, and often leads to blurry images and nasty artifacts. Also, some people just don't like the higher rate of upgrades and would prefer to disable the option. RELATED: Why Is My New HDTV Picture Watch Sped Up and Smooth? How to turn it off on Vizio TVs, open the settings menu, select Picture, and then switch to the Advanced Picture tab. Here you can set different levels for the Smooth Motion Effect, like adjusting how much interpolation and blurring motion is applied. You can disable it completely by installing it on Off. Vizio On some TVs, you may find an option may be under the image mode of the advanced video features. If you have an old TV with a feature, you may have to consult with the TV guide if you can't find an option that you can find online. If your Vizio TV seemingly displayed a black screen of death for no apparent reason, there is potential for shining light in that dark, dark screen. Here are some ways to fix Vizio TV black screen death. There are several root reasons for the TV screen suddenly coming out, but the most common reason is a glitch in one of the food tips. The TV can have one or more power boards in addition to the T-Con board and a number of other internal components. gaiamoments/Getty Images While these parts may seem complicated, they are actually relatively easy to fix. Before you rush to buy the necessary parts, you have to figure out what the problem is. There are various issues that can affect your television. You have to narrow down the problem before you try any repairs. Start with a sound test. Turn on the TV. Listen to the sound. If you don't hear anything, try to stream what you know will make noise. Make sure the volume is on. If you have sound but no image, the component that produces coverage for television is most likely an issue. You can narrow this down even more with a flashlight test. You should literally shed some light on this issue. Find a bright flashlight and make sure it has power. Crucify yourself about two inches from the TV screen and shed light on the TV. If you can see the image on the TV using a flashlight, this means that the inverter board in the TV went bad. Many times, the best solution is simple. Before you panic, make sure everything works properly and there are no free connections. Then perform a hard TV reset: Turn The Turn TV and turn it off. Press and hold the TV power button for 30 seconds. Release the power button and plug the TV back in. If you're trying to check an image from a device like a cable box, swap it for another device. If this fails, try accessing the settings menu on television. If you've tried all these methods and have an idea of what the problem might be, here are some ways to solve it. Replacing a power board can be difficult; Both the method used and the model board number will vary from television to television. However, it is still a fix that anyone can do at home with minimal experience. You will need: a soft cloth or a towel to protect the TV screen. A screwdriver with Philips head. The size will vary depending on the size of your TV. Container to place all the extracted screws of an inch Put the TV face down on the prepared surface. Remove all the rear screws with a screwdriver. Find all the fuses on TV. Most of them have five. If any of the fuses exploded, replace them. A blown fuse can often be the source of the problem, not the board itself. Find any wires that connect to the power board and remove them. Remove the screws that hold the power board and remove the old board. Place the new board in position and then gently screw it into position. We'll connect all the wires and cables. Replace the back of the TV and scrape it. Plug in the TV and check if the repairs worked. If the inverter board or other critical component is out, it should be replaced in the same way as the power board. However, if you don't feel confident in your ability to repair your TV without causing further damage, hire a repair technician to handle it. Excellent image quality Energy-saving blackout featureSlow to download appsMediocre contrast in low light scene Vizio E552VLE was the least expensive 55-inch TV in our test, but you won't guess that from watching it. At first glance, this Vizio is missing The subtle design of many other TVs (actually it's something of a behemoth, in this day and age of super-thin sets), but the image quality is good. The built-in full keyboard WERTY also helps with navigation, which makes this TV TV budget choice. While Vizio was not an outstanding set, we had few complaints during our performance testing. The scenes in The Dark Knight that were used to assess image quality looked good, but we found that the contrast level was less striking than that of other sets. The quality of the light picture in Avatar was impressive, although you could be turned off by bright, almost excessively saturated colors. In terms of system performance and speed, Vizio disappointed us with a long launch time. Energy consumption was average, but Vizio uses an automatic blackout function that helps save energy by modulating the brightness of the TV according to the

light level in the room. While some aspects of Vizio seem more forward thinking, this Smart TV home screen set seemed a little dated compared to other models. Consumer testers don't have any serious complaints, but they rated their experience visiting various sites and using apps such as Netflix, YouTube and Hulu as average at best. The layout of the application was functional and relatively easy to use, but it lacked a certain amount of Polish. The built-in WiFi made the wireless connection painless, and the full keyboard on the back of the remote control was a big plus when typing. Unfortunately, it also made the remote feeling a bit cluttered. We also sometimes had trouble getting a remote control to check in commands if we didn't sit right in front of the set.
